Contents

Chapter 1

Project Overview

Describe what your application does, its category, key features, input/output, and user interactions.

Chapter 2

Build Instructions

List exact commands to compile and run your project. Include any required input files or dependencies.

Chapter 3

Architecture Diagram

Include a diagram showing all processes (or server/clients) and their connections. Example:

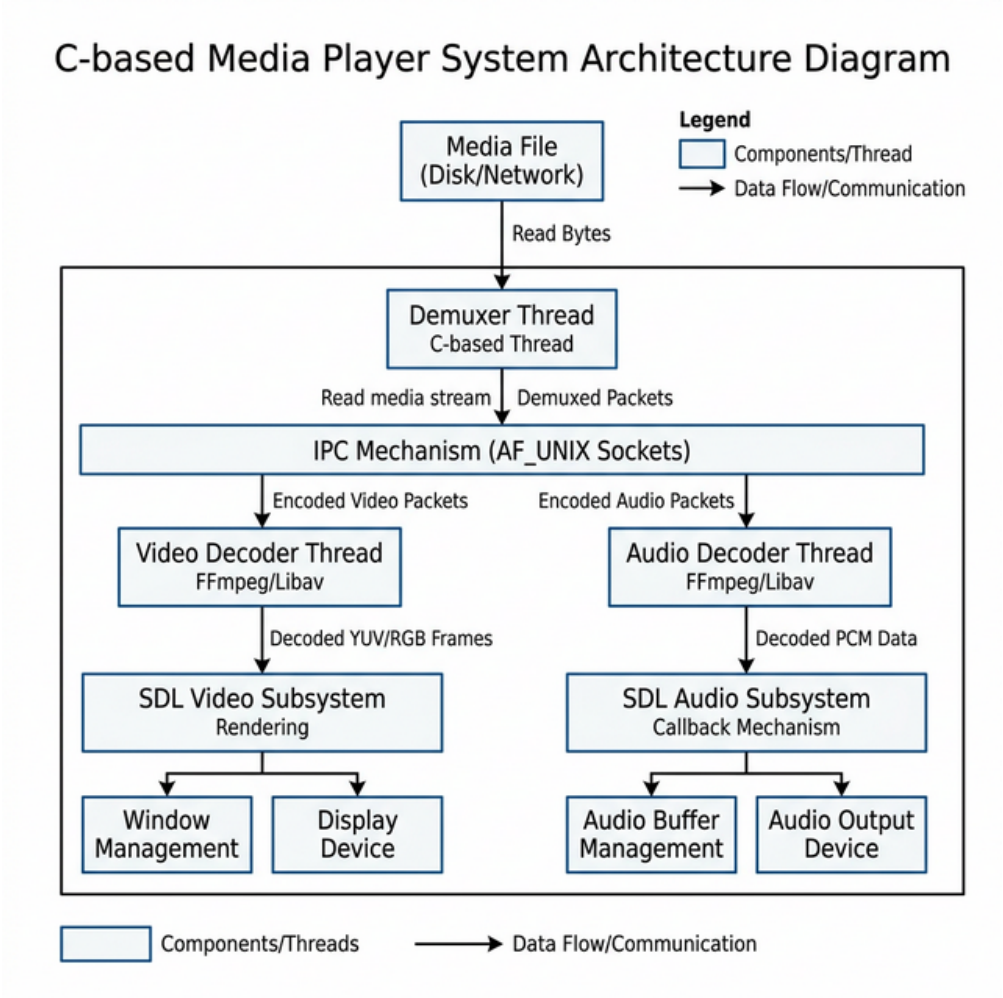

Figure 3.1: Overall project architecture.

Chapter 4

Communication Protocol

For each message type, describe:

- Sender and receiver
- Encoding
- Semantics / invariants
- Error handling

Chapter 5

Concurrency Model

Explain how your application handles concurrency:

- Forking and process coordination (Category 1)
- Select loops and fd sets (Category 2)
- How blocking is avoided

Chapter 6

Error Handling and Robustness

Describe at least three runtime error scenarios and how your code handles each. Example:

- Client disconnects mid-message
- Writing to a closed pipe
- Malformed command input

Chapter 7

Team Contributions

Briefly list each team member and their specific contributions.
